

## Discovery in Action @ Telstra

Skye Wu<sup>1</sup>

<sup>1</sup>Telstra

Discovery is an executive sponsored function that is designed to proactively identify risks the organisation's existing security controls do not see.

Discovery, first and foremost is about people, their investigative mindset, and ability to build relationships, collaborate and communicate; coupled with evolving analytics capability to contextualise security and business risk with a proactive approach. The outcome for Discovery work is to illuminate the risks and activities that are happening and unseen. This is achieved by interrogating the terabytes of data (and growing!) already collected by the organisation. Discovery uses advanced analytics based on mathematical algorithms to do "the heavy lifting" of processing vast volumes of data to provide a starting point for an analyst to begin their investigation.

The presentation will take you through some real life examples to illustrate how the Discovery team works; through various investigations and collaborations undertaken by the team and how the outcomes helped strengthen the organisation's security posture.
