

## Truth, Lies and Compromise – Incident prevention and recovery in a Microsoft Enterprise

Russell Tomkins<sup>1</sup>

<sup>1</sup>Microsoft

The operational security "fog of war" in modern IT environments is real and growing rapidly. With internal IT teams shrinking coupled with the increasing trend to outsource critical infrastructure management to external providers, the reality of what is believed to be happening inside our IT organisations and the stark truth may be one of the largest risks your organisation faces. These very same failures may also hamper even the best planned recovery efforts in the event they need to be executed. After 6 years of dissecting Microsoft infrastructure deployments and interrogating the administration staff that operate them, I will share with you the concerning trends that Microsoft Premier Field Engineers globally are witnessing on a weekly basis and the basic manoeuvres that you can implement to provide protections to your critical infrastructure. In the unwelcomed event of a system compromise, learn how Microsoft can partner directly with you to perform incident response, recover your network to a safe and controlled operational state and implement strategic remedies to increase operational security resilience and prevent further business impact.
